

BRAIN EXERCISE 46-numbers- challenging.

Some one must explain to me how the brain works.

I was looking for a new angle to one of my series of exercises that anyone who can count and has cognitive function can successfully complete, but would undergo a vigorous brain workout.

My thoughts were occupied with this challenge for weeks; then an idea came to me in my sleep. I immediately got up and started to create, I did not want to disturb the wife; I did get out of bed, so I worked on the computer with the lights.

When I am creating an exercise I must complete the exercise first. This exercise took me two weeks to complete.

This exercise will challenge your patience and cognitive skills. It is a vigorous brainwork out.

The Challenge

Complete the grid so that numbers one to nine appear in each row and each column as demonstrated in the first row and the first column.

Each row and each column must contain the numbers one to nine in the hundreds, tens and ones section.

The numbers can appear

192	283	374	465	546	657	739	821	918
913								
281								
824								
376								
738								
457								
569								
645
